Our Commitment to Quality

At Klondike Welding Ltd., quality is not just a deliverable—it's a mindset that shapes every step of our process. From engineering and detailing to fabrication and final installation, we are committed to providing work that meets the highest standards of precision, performance, and reliability.

Our reputation is built on the strength of our craftsmanship, the accuracy of our execution, and the consistency of our results. We take pride in delivering steel structures and components that not only meet design specifications, but also exceed client expectations for constructability, safety, and durability.

Klondike Welding Ltd. operates under a comprehensive Quality Management System, developed to align with industry best practices and the requirements of CSA W47.1, CSA W59. Every welded component leaving our facility is inspected and approved by our Certified Level 2 Welding Inspector, ensuring compliance with structural codes and the strictest quality criteria. Visual Testing (VT), Magnetic Particle Testing (MT), and Liquid Penetrant Testing (PT) are conducted in-house and documented to support traceability and transparency throughout the project lifecycle.

Our Quality Assurance program begins at the planning and procurement stages. We work closely with engineers and clients to understand project requirements, define tolerances, and coordinate inspection plans. Materials are verified upon arrival with corresponding mill test reports (MTRs), and every stage of fabrication is documented—from cutting and fit-up to final weld and surface preparation.

Clear shop drawings, engineered connection designs, and internal checklists support error-free production and field coordination. We also maintain open communication with contractors, consultants, and site personnel to quickly address issues and ensure installations meet site-specific needs.

In the field, our erection crews work in coordination with our QC team to confirm fit, alignment, and weld quality. We conduct field inspections and issue formal reports as required, supporting both project handover and warranty documentation.

We understand that our clients rely on us for more than just steel—they depend on us for accountability, predictability, and long-term performance. That's why we make quality a priority in everything we do—from the smallest bracket to the largest structural assembly.

At Klondike Welding Ltd., quality is not a department—it's a responsibility shared by every member of our team.

Philippe Vincent, P.GSC
